

WSSP Compendium

Public health, safe water supply and safe sanitation are very much interrelated and are often neglected or in their relevance underestimated, particularly in rural communities. Better protection and management of drinking water sources and sanitation facilities are possible, if weaknesses and strengths are identified. For the identification of possible sources of hazards and risks, the knowledge about an adequate quality of water and sanitation, the pathways of contamination and the associated risks, as well as the prevention of risks are essential. A Water and Sanitation Safety Plan (WSSP) is an efficient methodology to manage drinking water and sanitation safely. The WSSP is based on the Water Safety Plan and Sanitation Safety Plan approach by WHO.

This [WSSP Compendium](#) aims to enable communities to develop a WSSP for small-scale water supplies, e.g. dug wells, boreholes, springs and piped centralised water supply systems, and as well as to assess the quality of sanitation facilities such as school toilets. This second edition has been completely revised and updated.

The WSSP Compendium consists of three parts and is available in English, Macedonian, Romanian, Albanian and Bulgarian.
